SUMMARY

I'm a fullstack and mobile developer with more than 6 years of experience in software engineering. My core strengths are ReactJS, VueJS, and React Native, and I'm currently the Lead Mobile Developer for the Madani Tumbuh app at PT Permodalan Nasional Madani.

I'm experienced in backend development with Laravel and CodeIgniter, and comfortable integrating REST APIs and gRPC. I'm currently learning Go, Java (Spring Boot), Kafka, and Flutter and building my skills through personal projects such as Main Yuk (party games), BukuBesar (core banking), AgentGate, Rupa (a design system), Patungan, Mini ERP, Market Live, Bola Live, Jejak 42·50, Dompet Rumah, and an AI chatbot. I enjoy turning business requirements into functional, maintainable web and mobile apps.

EXPERIENCE

PT Permodalan Nasional Madani

Lead Mobile Developer Jun 2026 – Present

Coordinating the development and maintenance of the Madani Tumbuh mobile app to support customer financing operations across the Pipeline, Community, Prospect, Survey, Top Up, 3R, DNPT, and INI menus.

- Coordinating development of Pipeline and Community features to support loan application data and customer group management.
- Coordinating development of Prospect and Survey features to support financing opportunity assessments and records of customer needs.
- Coordinating development of the Top Up feature to support customer requests for additional financing.

React Native, TypeScript, Redux, Redux Saga, WatermelonDB, Axios

Staff Frontend Developer – Mobile Apr 2024 – Jun 2026

Developed and maintained features for the Madani Tumbuh mobile app using React Native and TypeScript to support customer financing operations.

- Developed the Pipeline feature to manage customer data for loan applications.
- Developed the Community feature to manage customer groups applying for loans.
- Developed the Prospect feature to support assessments of financing opportunities and risks.
- Developed the Survey feature to record financing needs surveys for businesses and households.

React Native, TypeScript, Redux, Redux Saga, WatermelonDB, Axios

Satkomindo Mediyasa – PT Bank Rakyat Indonesia Tbk

Frontend Developer Feb 2023 – Apr 2024

Developed and maintained the loan module interface for the NDS project at BRI using Vue.js to support loan transactions and reporting.

- Built cash and non-cash deposit, repayment, and disbursement features.
- Designed and developed the Brimitra loan module.
- Developed a feature for manually splitting cash and non-cash transactions to support loan operations.
- Developed collective payment reports and bulk transaction features for processing large volumes of deposits.
- Created loan account information reports to support account data checks.

Vue 2 & 3, Vuex, Options & Composition API, gRPC

MNC Media

Fullstack Developer Sep 2022 – Feb 2023

Developed and maintained an ad request and reporting system using React and Laravel, covering submissions by the sales team through follow-up by the marketing team.

- Optimized queries and added table indexes to improve application performance.
- Built the ad request flow from the sales team through to follow-up by the marketing team.
- Maintained the app to keep up with evolving advertising and promotion workflows.
- Designed UI mockups in Figma.

Laravel, React, Redux, Figma, Bitbucket

PT Haistar Bintang Dagang International

Fullstack Developer Aug 2021 – Jul 2022

Developed a system for reporting package movements from factories to customers using React and CodeIgniter, with data from PostgreSQL and MySQL.

- Built a queue system for report downloads to keep downloads running smoothly.
- Developed reporting modules (Excel and charts) for shipment, outbound, and inbound data.
- Optimized database queries and indexes to speed up data retrieval.
- Built a scheduler in Python and managed two databases (PostgreSQL and MySQL) for reporting.

CodeIgniter, React, Redux, Python, PostgreSQL, MySQL, GitHub

Dbisnis Network Indonesia

Frontend Developer Jun 2020 – Jun 2021

Developed application and website interfaces to support customer bookings using CodeIgniter and CSS.

CodeIgniter, HTML, CSS, SQL

PERSONAL PROJECTS

Pijak /demo/pijak/

Personal project: a shoe guide and running workspace connecting shoe selection with actual use. A catalog of 24 models across seven brands, including On, has manufacturer sources, activity filters, three-shoe comparison, and a preference finder. The running workspace covers easy, long, tempo, interval, recovery, race, and trail sessions; its calendar separates plans from recorded results. A three-way pace calculator, kilometer splits, eight-week charts, weekly goals, shoe rotation, cost per kilometer, and CSV/JSON exports connect to the activity log. Built with TanStack Start, React, TypeScript, and Rupa components. Tested with Vitest, React Testing Library, Playwright, and axe. The public demo runs in the browser with resettable illustrative data; Supabase Auth, PostgreSQL, Storage, and RLS schemas are prepared for account mode. The source repository remains private.

TanStack Start, React, TypeScript, Rupa Design System, CSS Modules, TanStack Query, Zod, Supabase, Vitest, Playwright, axe-core

Main Yuk raihan-evanza-main-yuk.vercel.app

Personal project: 12 party games for sharing one phone, from word guessing and Impostor to quick quizzes, sequence memory, and word chains. Includes 245 built-in cards, custom packs, favorites, timers, scores, and sessions that resume after a reload. Every web and mobile screen comes from Rupa components; the app supplies props and callbacks from a shared TypeScript game engine. WatermelonDB stores data locally, while a Ruby on Rails API and PostgreSQL provide account synchronization in the full app. The portfolio demo runs in the browser without an account or API server.

React, React Native, TypeScript, Rupa Design System, WatermelonDB, Ruby on Rails, PostgreSQL, RxJS, Vite, Vitest, Playwright, Docker

Dompet Rumah raihan-evanza-dompet-rumah.vercel.app

Personal project: a household finance app for couples, shared from two phones. Salaries per person, THR under Permenaker 6/2016 and annual bonuses prorated per month or per day, recurring bills ticked off when paid and turned into transactions, a monthly plan compared with actuals, savings goals with the deposit needed, and a 1–3 year balance projection. PDF or screenshot receipts are read in the browser (pdf.js and Tesseract) without being uploaded, bank statements import from CSV/Excel, and account balances show up on the partner's phone through Realtime. A React frontend talks to Supabase directly, with Row Level Security on every table and tested automatically; the public demo is a separate build that keeps all data in the browser with a fictional family.

React, TypeScript, Supabase, PostgreSQL, Row Level Security, TanStack Query, Tailwind CSS, Rupa Design System, Recharts, Tesseract.js, PWA, Vercel

BukuBesar — Core Banking raihan-evanza-bukubesar.vercel.app/login?as=teller

Personal project: an event-driven mini core banking system. Three Spring Boot services (accounts and ledger, transfers, notifications), each with its own database, talk over Kafka. Every transfer is a saga: funds are held, large transfers wait for a supervisor, then a double-entry journal is posted; when the interbank network rejects it or the destination is frozen, the funds are returned automatically (compensation). Events go through a transactional outbox to idempotent consumers, failed messages land in dead letter topics, and the ledger cannot be edited and always balances (enforced by database triggers). Tested: 50 concurrent transfers never overdraw an account, a service killed mid-saga resumes without losing anything, and replaying 1,700+ events changes nothing. A Vue 3 back office with a live Event Inspector (SSE), a React Native customer app, and a demo that runs the whole backend in the browser, all built on the Rupa design system (ledger brand) across web and mobile.

Java, Spring Boot, Kafka, PostgreSQL, Flyway, Testcontainers, Vue 3, Pinia, TanStack Query, React Native, TypeScript, Tailwind CSS, Docker, Rupa Design System

Rupa — Design System raihan-evanza-rupa.vercel.app

Personal project: a multi-brand design system reused across my projects and released on npm as @rupa-ui/tokens, @rupa-ui/react, and @rupa-ui/react-native. Every color, type size, spacing, and motion value comes from one token source (Style Dictionary) built into CSS variables, Tailwind v3/v4 presets, TypeScript, and a React Native palette, with five brands (violet, signal, latte, ledger, and mono) in light and dark modes that can be nested. 29 accessible React components (WCAG 2.2 AA) and 13 React Native components for Android and iOS with the same props, all documented in Storybook. Every story runs axe in ten themes (1,850 runs), keyboard interactions are tested automatically, 470 contrast pairs and a color-blind-safe chart palette are checked on every build, and 326 screenshots are compared on each pull request. Releases are automated with Changesets and GitHub Actions using npm trusted publishing with provenance. Used by AgentGate, Dompet Rumah, BukuBesar (web and mobile), Jejak 42·50, and this portfolio; the AgentGate migration surfaced five gaps (two new features and three bugs, including focus lost after closing a dialog), fixed in 0.3.

React, React Native, TypeScript, Storybook, Style Dictionary, Design Tokens, Vitest, Jest, Playwright, axe-core, Changesets, GitHub Actions, npm

AgentGate raihan-evanza-agentgate.vercel.app/?as=approver

Personal project: an approval gateway for AI agent tool calls such as refunds, database queries and writes, emails, and deployments. Every call goes through a per-tool policy engine: safe actions run immediately, risky ones wait for a human, forbidden ones are refused, and a rule that cannot be evaluated falls back to approval (fail-closed). An agent's owner cannot approve that agent's actions, status changes are guarded in the database so only one of two approvers clicking at once succeeds, and approved arguments are locked with a hash. Changes appear in real time over Server-Sent Events, agents wait for the outcome with long polling, and everything lands in an audit log. A Go + PostgreSQL backend, a React web console, and a React Native app (Android + iOS) for approvers; the demo runs entirely in the browser with an agent simulator.

Go, Gin, GORM, PostgreSQL, Server-Sent Events, React, React Native, TypeScript, RTK Query, Tailwind CSS, Rupa Design System

Patungan — Split Bill raihan-evanza-patungan.vercel.app/login

Personal project: a split bill app for sharing costs with friends. Bills can be split equally, by item (with tax, service charge, and discounts), or manually, and the shares always add up exactly to the total thanks to the largest remainder method. Group balances are simplified into just a few transfers (at most n-1), with payment confirmation by the recipient and automatic reminders. A Go backend with a gRPC (Connect) API, a React web dashboard, and a Flutter app (Android + iOS) with on-device receipt scanning.

Go, gRPC, Protocol Buffers, PostgreSQL, React, TypeScript, RTK Query, Tailwind CSS, Flutter, Riverpod

Mini ERP raihan-evanza-erp.vercel.app

Personal project: an inventory and order management app with approval-based purchase orders, partial goods receipts, sales orders with automatic stock reservation, and a per-warehouse stock ledger. Every stock change runs in a single database transaction so stock can never go negative. Includes role-based access, a KPI dashboard, two languages, and dark mode, plus a React Native mobile app (Android + iOS) for managers: dashboard, PO approve/reject, and sales order and stock monitoring.

Go, Gin, GORM, React, React Native, TypeScript, RTK Query, Tailwind CSS, SQL Server

Market Live market-live-raihan-evanza.vercel.app

Personal project: a live price dashboard for 80 instruments (IDX and US stocks, indices, crypto, gold including Antam, commodities, and currencies) built on free data sources with no API key. Crypto and spot gold update in real time over a Binance WebSocket straight from the browser, while Yahoo Finance data goes through Vercel Functions cached on the CDN. It has a trading plan with a breakout rule chosen through a 5-year backtest, a daily signal screener (Vercel Cron + Blob), price projections, a converter, and market news.

React, Vite, Vercel Functions, Vercel Cron & Blob, WebSocket, Lightweight Charts

Bola Live bola-live-olive.vercel.app

Personal project: an Indonesian-language football site with live scores, fixtures, and standings for 28 European, Asian, Southeast Asian, and national-team competitions, all in Jakarta time. ESPN data is cached on the server with Next.js revalidation, so the API is only called occasionally no matter how many people visit. It has match details, team profiles, score predictions, goal alerts, and shareable score cards, all without a database or user accounts.

Next.js 16, React 19, TypeScript, Tailwind CSS, ESPN API

Jejak 42·50 raihan-evanza-jejak.vercel.app

Personal project: a training-plan and running-journal PWA I use every day on the way to a 14 km relay leg, a full marathon, and a 50 km ultra. The plan is generated from the main races (including ultra phases up to 180K), can be changed one day or a whole month at a time, and adjusts to a morning check-in, logged sessions, and Huawei watch data via intervals.icu. It has load warnings before injuries, VO2max and Fitness · Fatigue · Form charts, a race-day plan, a Gemini AI coach, push notifications, and offline mode. A React frontend on the Rupa design system, 12 Vercel Functions, and Supabase (Auth + Postgres with row-level security): everyone has their own account, and a superadmin manages accounts without being able to open personal data.

React, Vite, Rupa Design System, PWA, Vercel Functions, Vercel Cron, Supabase, PostgreSQL, Gemini API, intervals.icu API, Web Push

Asisten — AI Chatbot github.com/raihanevanza/chat-bot-go

Personal project: a web chatbot whose answers stream word by word over Server-Sent Events and can be stopped mid-response. A dependency-free Go backend supports Gemini, OpenAI, and Anthropic (picked automatically based on the API key), plus a demo mode that needs no API key.

Go, React, Vite, SSE, Gemini API

PROFESSIONAL PROJECTS

Madani Tumbuh (MT)

PNM's mobile app supporting financing operations through the Pipeline, Community, Prospect, Survey, Top Up, 3R, DNPT, and INI menus. Covers customer data, borrower groups, prospects, financing needs surveys, and requests for additional financing, with local data support using WatermelonDB.

React Native, TypeScript, Redux Saga, WatermelonDB

NDS — BRI Loan Module

Loan module for deposits, repayments, disbursements, transaction splitting, Brimitra loans, collective payment reports, and bulk transactions.

Vue.js, Vuex, gRPC

Shipment Reporting System

Reporting module for package movements from factory to customer, with a download queue, Excel export, charts, and a Python scheduler.

CodeIgniter, React, PostgreSQL, MySQL

SKILLS

Frontend & Mobile: React, React Native, Flutter, Vue.js, Redux, Redux Saga, Vuex, TypeScript, JavaScript, Next.js, Tailwind CSS, HTML, CSS, Sass

Backend & Database: Laravel, CodeIgniter, Java, Spring Boot, Kafka, REST API, gRPC, MySQL, PostgreSQL, WatermelonDB, Ruby on Rails, Redis, Node.js, Python, Go

Tools & Others: Git, GitHub, Bitbucket, Figma, Vercel, PWA, Gemini API, Axios, jQuery / Ajax

EDUCATION

Master's in Computer Science — Universitas Esa Unggul 2025 — Present

Applied Bachelor's in Informatics Engineering — Politeknik Negeri Jakarta 2018 — 2022
3rd Place, KMIPN IT Business Competition · Top 10 Finalist, Codig 3.0

Informatics Engineering — CCIT — FTUI 2018 — 2020

LANGUAGES

Indonesian (Native) · English (Intermediate)
